

GRAPPLES

Similar in application to the skid steer grapples, the excavator grapple is designed to handle objects varying in size and shape. Remove large rocks, brush and debris with the excavator grapple. This attachment requires that a set of ears be welded to the excavator, then the operator can use the bucket curl cylinder to close the grapple. No auxiliary hydraulics are required for operation. Available in sizes from 18" (457 mm) to 42" (1067 mm).

Demolition and forestry type applications require additional operator protection, such as a poly-carbonate front window. Check application requirements.

Excavator Grapples*

Similar in application to the skid steer grapples, the excavator grapple is designed to handle objects varying in size and shape. Remove large rocks, brush, or debris with the excavator grapple. This attachment requires that a set of ears be welded to the excavator, then use the bucket curl cylinder to close the grapple. No additional (auxiliary) hydraulics are required for operation. Available in various sizes from 18" (457 mm) to 42" (1066 mm).

****Note: Demolition and forestry-type applications require additional operator protection, such as a poly-carbonate front window. Check application requirements.***
