MISU Mobile Integrated Screening Unit: Representing the Latest Steps Forward in Mobile Screening Technology.

Gorham, ME September 8, 2006 – National Attachments Incorporated is proud to introduce the ideal solution for “on-site” material handling, screening, mixing, and crushing operations.

The Australian manufactured MISU Mobile Integrated Screening Unit is now available to the U.S. with their patented and proven design. Guaranteeing operating cost reductions and maximum operation productivity, the MISU bucket eliminates multiple handling costs when processing endless types of material; soil, loam, clay, sand, salt, gravel, C&D, ETC.

The simple and logical design of the MISU scalping system acts as their main advantage. Processing different forms of material using their patented “Spinning Rotor System” (SRS) allows smaller particles to fall through while holding back larger debris. MISU signature “Floating Rotors” constantly work to shed material that would otherwise stick to rotors; therefore blinding the discharge envelope. This patented feature adds extreme versatility to the bucket, making it the ideal tool for processing and mixing both wet and dry materials.

MISU Party Ltd. provides highest quality, custom fabricated units to fit all excavator/loader and skid steer machines.

With a ¾”-3” screening range this fully mobile unit excels in tight, difficult terrain and wet conditions, guaranteeing the MISU screening unit a proven compliment to the pipeline, utility, demolition, and landfill reclamation industries. It’s also outstanding in high volume production of topsoil or compost.
